

# BeoPlay Case

Set up a page from PSD

Look at the .psd file and based on the psd-file, build a page as seen here. Try to find similar fonts, sizes of the elements, etc..

The following fonts are used: Proxima (Think, Italic, Bold) and Gotham (Thin, Bold). Find some similar web fonts.

If you have difficulties in getting started, look at the attached html code that will hopefully kickstart your development.

## **Part 1**

Start by creating the content layer (HTML). Choose some HTML tags that fit. Consider the semantic in and try to avoid the <div>.

There must be hover effects on the menu, these are not specified in the PSD, so you must choose how you want the effect.

tips:

<http://learnlayout.com/> have some good examples of current layout options.

Do not use float to make layout with, since it is often difficult to control. Display block / inline / inline-block can go a long way.

Use position absolute / relative / fixed to correct to the places where you want to reflect render flow.

Take one section at a time and work quiet and peaceful forward.

## **Part 2**

Use jQuery to make the functionality of the modal box in the bottom corner so that it can be closed. This must be like to be animated.

## **Task description – IMPORTANT:**

- The task is individual
- Focus on semantic HTML, CSS and Javascript / jQuery to the task.
- Absolutely latest deadline is Sunday september 18. at pm. 23:59
- Be uploaded as zip (firstname\_lastname.zip) to Fronter in Mandatory assignments

Good luck!

BR Kim
